Project Title:Student Assignment Deadline Tracker

Submitted by: Girik Balhotra
Roll Number: 25BAI10197
Department: B.Tech in Computer Sc.(AI&ML)
College: VIT Bhopal University

Date: 28th March, 2026

Introduction

Keeping track of multiple assignments, deadlines, and submissions can quickly become overwhelming for students, especially when balancing academics with personal life and extracurricular activities. A Student Assignment Deadline Tracker is a simple yet powerful tool designed to help students stay organized, manage their time effectively, and reduce last-minute stress.

This tracker allows students to record important details such as assignment titles, due dates, subject names, and priority levels in one place. By having a clear overview of upcoming deadlines, students can plan their work in advance, avoid procrastination, and ensure timely submissions. It also helps in breaking down larger tasks into smaller, manageable steps, making the overall workload feel less stressful.

In today's fast-paced academic environment, where multiple deadlines often overlap, having a structured system becomes essential. A well-designed assignment tracker not only improves productivity but also builds discipline and responsibility. It encourages students to take control of their schedule, leading to better academic performance and a more balanced lifestyle.

Overall, a Student Assignment Deadline Tracker acts as a personal assistant that keeps students on track, helping them stay focused, organized, and confident throughout their academic journey.

Problem statement

In today's academic environment, students are often juggling multiple subjects, assignments, projects, and deadlines at the same time. It becomes difficult to remember every due date, especially when different courses have different submission formats and schedules. Many students rely on memory, scattered notes, or messages, which can easily lead to confusion, missed deadlines, and last-minute stress.

Because of poor organization and time management, students may submit assignments late or rush through them without proper understanding, affecting both their performance and confidence. There is a clear need for a simple and reliable system that helps students keep track of all their academic tasks in one place and plan their work efficiently.

Problem solution

To solve this problem, a **Student Assignment Deadline Tracker** can be developed. This tool will act like a personal academic planner where students can store, manage, and monitor all their assignments and deadlines in an organized manner.

The tracker will allow students to add assignments along with details such as subject name, deadline, and priority. It will also provide reminders before deadlines so that students don't forget important submissions. By giving a clear overview of upcoming tasks, the system will help students plan ahead, reduce last-minute pressure, and improve their productivity.

The goal is to make academic life simpler and more structured, helping students stay on top of their responsibilities without feeling overwhelmed.

Functional Requirements

1. **Add Assignment**
    - Students should be able to enter assignment details like title, subject, deadline, and description.
2. **View Assignments**
    - The system should display all assignments in a clear list format, sorted by deadline or priority.
3. **Edit and Delete Assignments**
    - Students should be able to update details or remove assignments when needed.
4. **Deadline Reminders**
    - The system should notify students before the due date (e.g., 1 day or a few hours before).
5. **Priority Setting**
    - Students should be able to mark assignments as high, medium, or low priority.
6. **Status Tracking**
    - Each assignment should have a status such as “Pending,” “In Progress,” or “Completed.”
7. **Search and Filter**
    - Students should be able to search assignments by subject or filter them based on status or priority.
8. **User-Friendly Interface**
    - The tracker should be simple, clean, and easy to use so that students can quickly access information without confusion.

Non-functional requirements

Apart from what the system does, it's equally important to focus on how well it performs and how comfortable it is for students to use. These are called non-functional requirements, and they make the overall experience smooth and reliable.

1. **Usability (Ease of Use)**
   The tracker should be very simple and easy to understand, even for someone using it for the first time. Students shouldn't need any training to use it. A clean layout and clear options will make navigation quick and stress-free.
2. **Performance**
   The system should respond quickly when adding, editing, or viewing assignments. There should be no noticeable lag, even if a student has many assignments stored.
3. **Reliability**
   The tracker should work consistently without crashes or errors. Students should be able to trust that their data is safe and always available when needed.
4. **Accessibility**
   The system should be accessible on different devices such as laptops, tablets, and mobile phones. This ensures students can check their assignments anytime, anywhere.
5. **Scalability**
   The system should be able to handle an increasing number of assignments or users without slowing down. As the workload grows, the performance should remain stable.
6. **Security**
   Student data should be protected. If the system includes login features, it should ensure that personal information and assignment details are kept private and secure.
7. **Maintainability**
   The system should be easy to update or improve in the future.

Developers should be able to fix bugs or add new features without causing major issues.

8. **Availability**

   The tracker should be available whenever students need it, with minimal downtime. Ideally, it should work 24/7 without interruptions.

9. **Consistency**

   The design and behavior of the system should remain consistent throughout, so students don’t get confused while using different features.

System Architecture

The **Student Assignment Deadline Tracker** is designed using a simple and practical architecture so that it is easy to use, maintain, and expand in the future. The system follows a **three-layer architecture**, which separates different parts of the application to make it more organized and efficient.

---

1. Presentation Layer (User Interface)

This is the part of the system that students directly interact with. It can be a mobile app, web application, or even a desktop interface.

Here, students can:

- Add new assignments
- View upcoming deadlines
- Edit or delete tasks
- Mark assignments as completed

The interface should be clean and easy to understand so that students can quickly access what they need without confusion. The goal is to make everything feel simple and intuitive.

---

2. Application Layer (Logic / Processing Layer)

This layer acts like the “brain” of the system. It processes all the actions performed by the user and decides what should happen next.

For example:

- When a student adds an assignment, this layer saves the data
- It sorts assignments based on deadlines or priority
- It triggers reminders before due dates
- It updates the status of assignments (Pending, Completed, etc.)

This layer ensures that everything works correctly behind the scenes and that the system behaves as expected.

---

3. Data Layer (Database)

This is where all the information is stored securely.

It keeps records of:

- Assignment details (title, subject, deadline, etc.)
- Status and priority of tasks
- User data (if login is included)

The database ensures that all data is saved properly and can be retrieved whenever the student needs it. Even if the app is closed, the data remains safe.

How It All Works Together

When a student interacts with the system, the request flows through all three layers:

1. The student enters data in the **interface (Presentation Layer)**
2. The request is processed in the **Application Layer**
3. The information is stored or retrieved from the **Data Layer**

The result is then shown back to the student in a simple and clear way.

Why This Architecture Works Well

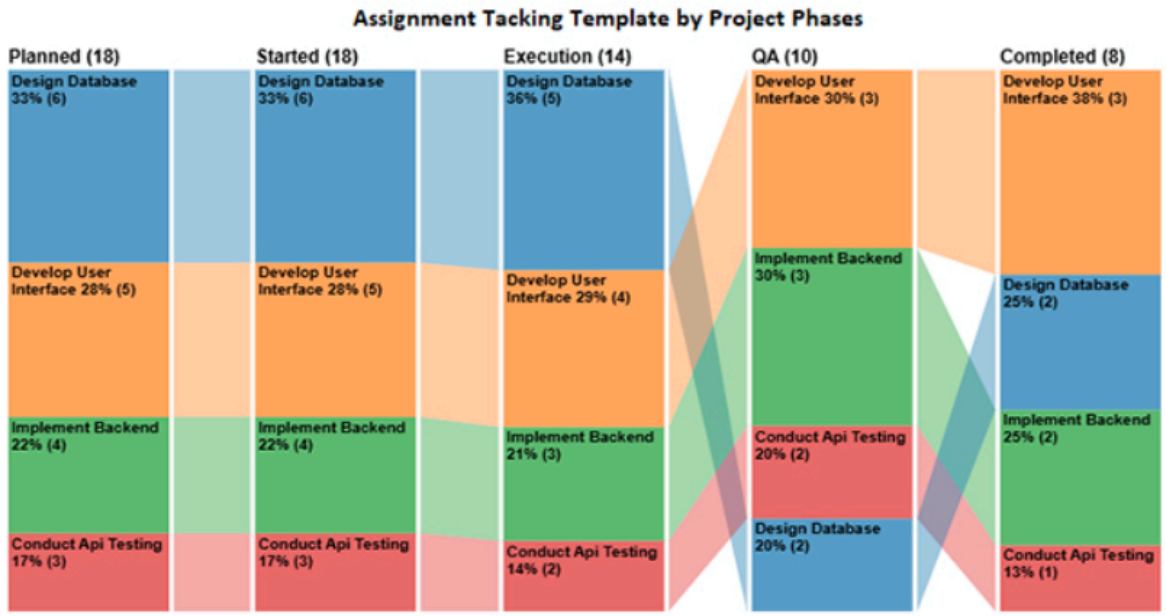
This structure keeps everything organized:

- Changes in the interface don’t affect the database
- The system becomes easier to maintain and update

- It can be expanded in the future (like adding notifications or cloud sync)

Design Diagrams

Comparison Bar Chart:



Design Decisions & Rationale

While building the **Student Assignment Deadline Tracker**, several design decisions were made to ensure that the system is practical, easy to use, and actually helpful in a student's daily life. Each decision was taken with a clear purpose, keeping real student problems in mind.

---

1. Simple and Clean Interface

Decision: Keep the design minimal with clear buttons and easy navigation.
Rationale: Students don't want to spend time learning how to use a tool. A simple interface helps them quickly add or check assignments without confusion, especially during busy schedules.

---

2. Three-Layer Architecture

Decision: Use Presentation, Application, and Data layers.
Rationale: This separation keeps the system organized. It makes future updates easier, reduces errors, and ensures that changes in one part (like UI) don't affect the whole system.

---

3. Priority-Based Task Management

Decision: Allow assignments to be marked as high, medium, or low priority.
Rationale: Not all assignments are equally urgent. This helps students focus on what needs immediate attention instead of feeling overwhelmed by everything at once.

---

4. Deadline Reminders

Decision: Include notification or reminder features before due dates.
Rationale: Students often forget deadlines due to multiple tasks. Timely reminders reduce last-minute stress and help in better planning.

---

5. Status Tracking (Pending / In Progress / Completed)

Decision: Provide status labels for each assignment.
Rationale: This gives students a sense of progress and clarity. It also helps them quickly identify what is left to do.

---

6. Cross-Platform Accessibility

Decision: Make the system usable on mobile and desktop.
Rationale: Students don't always sit in front of a laptop. Having access on phones allows them to check or update tasks anytime, anywhere.

---

7. Lightweight and Fast Performance

Decision: Keep the system simple without unnecessary heavy features.
Rationale: Students prefer fast and responsive tools. A lightweight system ensures smooth performance even on basic devices.

---

8. Data Safety and Storage

Decision: Store assignment data securely (locally or in a database).
Rationale: Losing assignment data can be frustrating. Reliable storage ensures that all information is محفوظ (safe) and always accessible.

---

9. Easy Edit and Delete Options

Decision: Allow users to quickly modify or remove assignments.
Rationale: Plans can change. Students need flexibility to update deadlines or remove completed/unnecessary tasks easily.

---

10. Future Expandability

Decision: Design the system in a way that new features can be added later.
Rationale: In the future, features like calendar integration, cloud sync, or collaboration can be added without rebuilding the entire system.

Overall Thought Process

The main idea behind every design decision was to keep the system **student-friendly, stress-free, and practical**. Instead of making it complex, the focus was on solving real problems like forgetting deadlines, poor planning, and lack of organization.

Implementation Details

Component	Description
Technology Stack	Frontend: HTML, CSS, JavaScript (or React) Backend: Node.js or Python Database: Local Storage / MySQL / MongoDB
Assignment Management Module	Handles adding, editing, and deleting assignments. Stores details like title, subject, deadline, and priority.
Reminder Module	Tracks upcoming deadlines and sends alerts or notifications to remind students before submission time.
Status Tracking Module	Allows users to mark assignments as Pending, In Progress, or Completed and updates progress.
Display & Sorting Module	Shows assignments in an organized list and sorts them based on deadline or priority for easy viewing.
Working Process	1. User opens app 2. Adds assignment 3. Data gets stored 4. Assignments displayed 5. Reminders triggered 6. Status updated by user
Data Structure	Each assignment includes: Title, Subject, Deadline, Priority, and Status.
User Interface Design	Simple form for input, dashboard for viewing tasks, buttons for edit/delete, and color indicators for urgency.
Testing	Check for errors, ensure data is saved properly, verify reminders and system response.
Future Improvements	Add calendar view, cloud sync, better notifications, and multi-device support.

Screenshots

1.**Main Menu.**

```
===== Assignment Tracker =====
1. Add Assignment
2. View Assignments
3. Mark as Completed
4. Delete Assignment
5. Exit
```

2. **The view the table is showing.**

```
Enter your choice: 3

--- Your Assignments ---
No assignments found.
```

3. **Result.**

```
Enter assignment number to mark completed: 3
❌ Invalid choice
```

Testing Approach

Test Case	Steps	Expected Result	Actual Result
TC-01: Add & View Assignment	1. Add assignment (Title: Math HW, Subject: Maths, Deadline: 2026-04-01). 2. View assignments.	Assignment is successfully added and displayed in the list with correct details.	Pass
TC-02: Mark Assignment Completed	1. Add an assignment. 2. Mark it as completed. 3. View assignments.	Status of the assignment changes from “Pending” to “Completed”.	Pass
TC-03: Delete Assignment	1. Add two assignments. 2. Delete one assignment. 3. View assignments.	Selected assignment is removed and remaining assignment is displayed correctly.	Pass
TC-04: Empty Assignment List	1. Start program without adding any assignment. 2. View assignments.	System displays message like “No assignments found.”	Pass
TC-05: Invalid Input Handling	1. Try adding assignment with empty fields.	System shows warning message and does not add assignment.	Pass
TC-06: Sorting by Deadline	1. Add multiple assignments with different deadlines. 2. View assignments.	Assignments are displayed in order of nearest deadline first.	Pass

TC-07: Data Persistence	1. Add assignments. 2. Restart the program. 3. View assignments.	Previously added assignments are still available (data saved properly).	Pass

Challenges faced

While developing the **Student Assignment Deadline Tracker**, a number of practical challenges came up. These weren't just technical issues, but also related to understanding how students actually manage their work in real life.

---

1. Keeping the Design Simple Yet Useful

One of the biggest challenges was deciding how much functionality to include without making the system complicated. Adding too many features could confuse users, while too few would make the tracker less useful. Finding the right balance between simplicity and usefulness required careful thinking.

---

2. Handling Multiple Assignments Efficiently

Students often have many assignments at the same time, sometimes with overlapping deadlines. Organizing and displaying these in a clear way (like sorting by deadline or priority) was a bit tricky, especially while keeping the interface clean.

---

3. Implementing Data Storage

Ensuring that assignment data is saved properly and not lost after closing the program was another challenge. Choosing between simple storage (like local files) and more advanced databases required understanding both ease of use and reliability.

---

4. Managing User Input Errors

In real use, students might enter incomplete or incorrect data (like missing deadlines or empty fields). Handling these cases properly and showing meaningful error messages was important to make the system user-friendly.

---

5. Creating an Effective Reminder System

Designing a reminder feature that actually helps students without being annoying was not very easy. The challenge was to make it timely and useful so that students stay aware of deadlines without feeling overwhelmed.

---

6. Ensuring Smooth Performance

Even though the system is simple, it still needed to run smoothly without delays. Making sure that adding, deleting, and viewing assignments happens instantly was important for a good user experience.

---

7. Making It Practical for Real Life

Another challenge was thinking beyond just coding and focusing on real student needs. The system had to feel like something students would actually use daily, not just a project made for submission.

---

8. Planning for Future Improvements

While building the basic version, it was also important to keep the design flexible so that features like calendar view, notifications, or cloud storage could be added later. Designing with future expansion in mind required extra planning.

Overall Experience

These challenges helped in understanding both technical aspects and user behavior. Instead of being obstacles, they guided the development process and helped in building a system that is not only functional but also practical and student-friendly.

Learnings & Key Takeaways

Working on the **Student Assignment Deadline Tracker** was not just about building a project, but also about understanding real-life problems and finding simple solutions for them. Throughout the process, several important learnings came up that go beyond just coding.

---

1. Importance of Time Management

This project made it clear how important it is to manage time properly. By designing a system that tracks deadlines, it became easier to understand how small delays can lead to bigger problems. It highlighted the value of planning work in advance.

---

2. Simplicity is Powerful

One of the biggest takeaways was that a system doesn't need to be complicated to be useful. A simple, clean, and easy-to-use design can often be more effective than adding too many features that confuse the user.

---

3. Understanding User Needs

Instead of just focusing on coding, this project required thinking from a student's perspective. What problems do students actually face? What would make their life easier? This helped in building a more practical and relatable solution.

---

4. Hands-on Experience with Development

The project provided practical experience in:

- Writing structured code
- Handling data (storage and retrieval)
- Managing user input and errors

This helped in strengthening basic programming and problem-solving skills.

---

5. Importance of Data Management

Storing and organizing assignment data properly was an important part of the system. It showed how structured data makes it easier to manage, update, and retrieve information when needed.

---

6. Problem-Solving Approach

There were multiple small challenges during development, and solving them step by step improved logical thinking. It taught how to break a big problem into smaller, manageable parts.

---

7. User Experience Matters

A system may work perfectly in the background, but if it is not easy to use, it loses its value. This project highlighted how important it is to focus on user experience along with functionality.

---

8. Thinking Ahead (Future Scope)

While building the basic version, it became clear that systems should always be designed with future improvements in mind. Features like reminders, mobile access, or cloud storage can be added later if the base is strong.

Overall Reflection

This project was a great learning experience that combined both technical knowledge and real-world understanding. It showed that even a simple idea, when implemented properly, can make a meaningful difference in everyday life.

Future enhancements

While the current version of the **Student Assignment Deadline Tracker** covers the basic needs, there is a lot of scope to make it more powerful and user-friendly in the future.

---

1. Smart Reminder System

In future versions, the tracker can include advanced reminders such as notifications on mobile or email alerts. This would ensure that students never miss important deadlines, even when they are busy with other activities.

---

2. Calendar Integration

A calendar view can be added where all assignments are displayed date-wise. This will help students visually plan their schedule and easily identify busy days.

---

3. Cloud Storage & Sync

Instead of storing data only on one device, cloud integration can be added. This will allow students to access their assignments from multiple devices like phones, laptops, or tablets without losing data.

---

4. User Login System

A login feature can be introduced so that each student has their own personalized dashboard. This will also improve data privacy and organization.

---

5. Mobile Application

Developing a dedicated mobile app will make the tracker more accessible. Students can quickly check or update assignments on the go.

---

6. Collaboration Feature

Students working on group projects can share assignments and track progress together. This will make teamwork more organized and transparent.

---

7. Progress Analytics

The system can provide insights like:

- Number of completed assignments
- Pending tasks
- Time taken to complete work

This will help students understand and improve their productivity.

---

8. AI-Based Suggestions (Advanced)

In the future, smart suggestions can be added, such as:

- Recommending which task to do first
- Suggesting better time management strategies
